                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SEQUENCE OF 206-775 FROM N.A.
                                                                                                                                                                                                                                                                                                                  SUBCELLULAR LOCATION: Cytoplasmic. Expression shifts from the cytoplasm to the plasma membrane upon stimulation with NGF. TISSUE SPECIFICITY: Ubiquitous and in the seminiferous tubules expressed in sertol1 cells but not in germ cells. Expression decreases in all tissues with increased age and is detectable of the content of the cells of the cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             progression, and facilitates p75NTR-mediated apoptosis. May a regulator of the function of DLX family members. SUBUNIT: INTERACTS WITH DLX5, DLX7 AND MSX2 AND FORMS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   FUNCTION: Involved in the apoptotic response after nerve factor (NGF) binding in neuronal cells. Binds p75NTR and antagonizes its association with TrkA, inhibits cell cycles.
                                                                             FRAMESHIFT IN POSITION 726.

-!- CATALYTIC ACTIVITY: Phosphatidylcholine + H(2)0 = 1-
acylglycerophosphocholine + a fatty acid anion.
-!- CATALYTIC ACTIVITY: 2-lysophosphatidylcholine + H(2)0 =
glycerophosphocholine + a fatty acid anion.
-!- ENZYME REGULATION: STIMULATED BY AGONISTS SUCH AS ATP, EGF,
THROWBRIN AND BRADYKININ AS WELL AS BY CYTOSOLIC CA2+.
-!- SUBCELLULAR LOCATION: CYTOPLASMIC. TRANSLOCATES TO MEMBRANE
VESICLES IN A CALCIUM-DEPENDENT FASHION (BY SIMILARITY).
-!- DOMAIN: THE N-TERMINAL C2 DOMAIN, BY ITS ASSOCIATION WITH LIPID
MEMBRANES, MEDIATES THE REGULATION OF CPLA2 BY PRESENTING THE
ACTIVE SITE TO ITS SUBSTRATE IN RESPONSE TO ELEVATIONS OF
CYTOSOLIC CA2+ (BY SIMILARITY).
-!- PTM: ACTIVATED BY PHOSPHORYLATION ON A SERINE RESIDUE (BY
SIMILARITY): CONTAINS 1 C2 DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               modified and this statement is not removed. entitles requires a license agreement (See or send an email to license@isb-sib.ch).

INTERACTS WITH THE BETA-1 INTEGRIN VLA4 ON LEUKOCYTES, AND MEDIATES BOTH ADHESION AND SIGNAL TRANSDUCTION. THE VCAMI/VLA4 INTERACTION MAY PLAY A PATHOPHYSIOLOGIC ROLE BOTH IN IMMUNE RESPONSES AND IN LEUKOCYTE EMIGRATION TO SITES OF INFLAMMATION.

SUBCELLULAR LOCATION: Type I membrane protein.

SUBCELLULAR LOCATION: Type I sofforms; A LONG FORM (SHOWN ALTERNATIVE PRODUCTS; AT LEAST 2 ISOFFORMS; A LONG FORM (SHOWN HERE) AND A SHORT FORM; ARE PRODUCED BY ALTERNATIVE SPLICING.

TISSUE SPECIFICITY: EXPRESSED ON INFLAMED VASCULAR ENDOTHELIUM, AS WELL AS ON MACROPHAE-LIKE AND DENDRITIC CELL TYPES IN BOTH NORMAL AND TATELAMED TISSUES OF THE STREET 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A41288;

FUNCTION: Involved in cell wall degradation. De polysaccharides containing beta-(1-->4) linked as an exo-(1-->4)-beta-D-galactanase.

CATALYTIC ACTIVITY: Hydrolysis of terminal, non galactose residues in beta-D-galactosides.

SIMILARITY: BELONGS TO FAMILY 35 OF GLYCOSYL HY

"Characterization of a sperm-specific nuclear autoantigenic protein.

"Complete sequence and homology with the xenopus protein, N1/N2.";

Biol. Reprod. 43:59-568(1990).

-!- FUNCTION: MAY PLAY A ROLE IN REGULATING THE EARLY EVENTS OF SPERMATOGENESIS BY BINDING NEWLY SYNTHESIZED HISTONES VARIANTS AI TRANSPORTING THEM TO THE NUCLEUS.

-!- SUBCELLULAR LOCATION: NUCLEUS.

-!- SUBCELLULAR LOCATION: NUCLEUS.

-!- SIBILARITY: WITH XENOPUS HISTONE-BINDING PROTEIN N1/N2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        REPEAT

Nature 404:502-506(2000).

-I- FUNCTION: This protein is involved in the repair of mismatches in DNA. It is required for dam-dependent methyl-directed DNA mismatch repair. May act as a "molecular matchmaker", a protein that promotes the formation of a stable complex between two or more DNA-binding proteins in an ATP-dependent manner without itself being part of a final effector complex (By similarity).

-I- SIMILARITY: BELONGS TO THE DNA MISMATCH REPAIR MUTL/HEXB FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Parkhill J., Achtman M., James K.D., Bentley S.D., Churcher Klee S.R., Morelli G., Basham D., Brown D., Chillingworth T Davies R.M., Davis P., Devlin K., Feltwell T., Hamlin N., HO Jagels K., Leather S., Moule S., Mungall K., Quail M.A., Rutherford K.M., Simmonds M., Skelton J., Whitehead S., Spratt B.G., Barrell B.G.; Skelton J., Whitehead S., Spratt B.G., Barrell B.G.; Train of Neisseria Complete DNA sequence of a serogroup A strain of Neisseria meningitidis 22491.

                                                                                                                                                                                                                                                                                                                                                                                                                                                     PRINCTION: This protein is involved in the repair of mismatches in DNA. It is required for dam-dependent methyl-directed DNA mismatch repair. May act as a "molecular matchmaker", a protein that promotes the formation of a stable complex between two or more DNA-binding proteins in an ATP-dependent manner without itself being part of a final effector complex (By similarity).

SIMILARITY: BELONGS TO THE DNA MISMATCH REPAIR MUTL/HEXB FAMILY.

SUBCELLULAR LOCATION: Integral membrane protein.
TISSUE SPECIFICITY: Widely expressed. Most abund liver, uterus, ovary and heart. Lower levels see intestine. Extremely low in calvaria, mammary glanterstine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          FUNCTION: Receptor for What proteins. Most of frizzled receptors are coupled to the beta-catenin canonical signaling pathway, which leads to the activation of dishevelled proteins, inhibition of GSK-3 kinase, nuclear accumulation of beta-catenin and activation of What target genes. A second signaling pathway involving PKC and calcium fluxes has been seen for some family members, but it is not yet clear if it represents a distinct pathway or if it can be integrated in the canonical pathway, as PKC seems to be required for What-mediated inactivation of GSK-3 kinase. Both pathways seem to require the control of the control of GSK-3 kinase. Both pathways seem the canonical pathway has pkc seems to be required to what was the control of GSK-3 kinase. Both pathways seem the control of GSK-3 kinase seem the control of GS
